# 1. SAFETY REGULATIONS AND INFORMATION

Read these operating instructions carefully before starting work on the device. Observe the following warnings to prevent malfunctions or danger to persons.

These operating instructions are to be regarded as part of the device. The device is only to be sold or passed on together with the operating instructions.

These operating instructions may be duplicated and distributed to inform about potential dangers and their prevention.

# 1.1 Hazard levels for warnings

These operating instructions use the following hazard levels to indicate potentially hazardous situations and important safety regulations:

1

1

1

1

1

2

#### DANGER

Indicates an imminently hazardous situation which will result in death or serious injury if the specified actions are not taken. Compliance with the instructions is imperative.

#### WARNING

Indicates a potentially hazardous situation which can result in death or serious injury if the specified actions are not taken. Exercise extreme caution while working.

## CAUTION

Indicates a potentially hazardous situation which can result in minor or moderate injury or damage to property if the specified actions are not taken.

# NOTE

A potentially harmful situation can occur and, if not avoided, can lead to property damage.

# 1.2 Staff qualifications

The device may only be transported, unpacked, installed, operated, maintained and otherwise used by suitably qualified, trained and authorized technical staff.

Only authorized specialists are permitted to install the device, to carry out a test run and to perform work on the electrical installation.

# 1.3 Basic safety rules

The safety hazards associated with the device must be assessed again following installation in the final product.

The locally applicable industrial safety regulations are always to be observed when working on the device.

Keep the workplace clean and tidy. Untidiness in the work area increases the risk of accidents.

Note the following when working on the device:

⇒ Do not perform any modifications, additions or conversions on the device without the approval of ebm-papst.

# 1.4 Voltage

- ⇒ Check the device's electrical equipment at regular intervals; see Chapter 6.4 Safety inspection.
- > Replace loose connections and defective cables immediately.

Electrically charged device Risk of electric shock

→ When working on an electrically charged device, stand on a rubber mat.

Item no. 57895-5-9970 · ENU · Change 218407 · Approved 2020-12-17 · Page 1 / 16

anslation of the onginal operating insti

# **Operating instructions**

## WARNING

Live terminals and connections even with device switched off

Electric shock

 $\rightarrow$  Wait five minutes after disconnecting the voltage at all poles before opening the device.

#### CAUTION

# In the event of a fault, the rotor and the impeller will be energized

The rotor and the impeller have basic insulation.

 $\rightarrow$  Do not touch the rotor and impeller once installed.

#### CAUTION

If control voltage or a stored speed set value is applied, the motor will restart automatically, e.g. after a power failure.

#### Risk of injury

- $\rightarrow$  Keep out of the device's danger zone.
- → When working on the device, switch off the line voltage and ensure that it cannot be switched back on.
- $\rightarrow$  Wait until the device comes to a stop.
- → After working on the device, remove any tools or other objects from the device.

#### 1.5 Safety and protective features

## Guard missing and guard not functioning

Without a guard, hands may become caught up in the device during operation for example, resulting in serious injury. Loose parts or items of clothing could be drawn in.

- → The device is a built-in component. As the owner, you are responsible for ensuring that the device is adequately safeguarded.# Operate the device only with a fixed protective device and guard grill.
- → Stop the device immediately if a protective device is found to be missing or ineffective.

#### 1.6 Electromagnetic radiation

Interference from electromagnetic radiation is possible, e.g. in conjunction with open- and closed-loop control devices.

If impermissible radiation levels occur following installation, appropriate shielding measures have to be taken by the user.

#### NOTE

# Electrical or electromagnetic interference after installing the device in customer equipment.

 $\rightarrow$  Verify that the entire setup is EMC-compliant.

#### 1.7 Mechanical movement

#### DANGER Rotating device

Risk of injury to body parts coming into contact with the rotor or the impeller.

- $\rightarrow$  Secure the device against accidental contact.
- → Before working on the system/machine, wait until all parts have come to a standstill.

Item no. 57895-5-9970 · ENU · Change 218407 · Approved 2020-12-17 · Page 2 / 16

#### DANGER Ejected parts

Missing protective devices may cause balancing weights or broken fan blades to be ejected and cause injuries.

 $\rightarrow$  Take appropriate safety measures.

#### WARNING

#### **Rotating device**

Long hair and dangling items of clothing, jewelry and the like can become entangled and be pulled into the device. Injuries can result.

- → Do not wear any loose-fitting or dangling clothing or jewelry while working on rotating parts.
- $\rightarrow$  Protect long hair with a cap.

#### 1.8 Emissions

#### WARNING

Depending on the installation and operating conditions, the sound pressure level may exceed 70 dB(A). Risk of noise-induced hearing loss

- $\rightarrow$  Take appropriate technical safety measures.
- → Protect operating personnel with appropriate safety equipment such as hearing protection.
- $\rightarrow$  Also observe the requirements of local agencies.

#### 1.9 Hot surface

# CAUTION

High temperature on electronics housing Risk of burns

→ Ensure sufficient protection against accidental contact.

#### 1.10 Transport

#### WARNING

Transporting the fan

Injuries from tipping or slipping

- → The fan is always to be transported with care and in its original packaging.
- → If set down too hard or at an angle for example, the impact can lead to bearing damage or deformation of the frame or impeller.
- → It must be ensured that the fans cannot tip over during transportation and handling.
- → Secure the fan(s) with appropriate equipment such as a lashing strip so that nothing can slip or tip, especially when stacking multiple fans.
- $\rightarrow$  Also make allowance for possible wind forces.

#### NOTE Transporting the device

 $\rightarrow$  Transport the device in its original packaging only.

ebmpapst

ranslation of the original operating instructions

#### 1.11 Storage

- ⇒ Store the device, partially or fully assembled, in a dry place, protected against the weather and free from vibration, in the original packaging in a clean environment.
- Protect the device against environmental effects and dirt until final installation
- We recommend storing the device for no longer than one year in order to guarantee trouble-free operation and the longest possible service life.
- ⇒ Even devices explicitly intended for outdoor use are to be stored as described prior to commissioning.
- Maintain the storage temperature, see Chapter 3.6 Transport and storage conditions.
- ⇒ Make sure that all cable glands are fitted with dummy plugs.

# 2. INTENDED USE

The device is exclusively designed as a built-in device for conveying air according to its technical data.

Any other usage above and beyond this does not conform with the intended purpose and constitutes misuse of the device.

Customer equipment must be capable of withstanding the mechanical and thermal stresses that can arise from this product. This applies for the entire service life of the equipment in which this product is installed.

#### Intended use also includes

- · The device is only to be used in power systems with grounded neutral (TN/TT power systems), in power systems with phase conductor grounding, or in IT power systems.
- The device is to be used in networks with network quality • characteristics as per EN 50160.
- Using the device only in stationary systems.
- Performing all maintenance work.
- Conveying air at an ambient air pressure between 800 mbar and 1050 mbar.
- Using the device within the permitted ambient temperature range; see • Chapter 3.6 Transport and storage conditions and Chapter 3.2 Nominal data.
- Operating the device with all protective devices.
- Following the operating instructions.

#### Improper use

In particular, operating the device in the following ways is prohibited and could be hazardous:

- Operating the device in an unbalanced state, e.g. due to dirt deposits or ice formation.
- Resonant operation, operation with severe vibration. This also includes vibration transmitted to the fan from the customer installation.
- Operation in medical equipment with a life-sustaining or life-support function
- Conveying solids in the flow medium. •
- Painting the device •
- Connections (e.g. screws) coming loose during operation.
- Opening the terminal box during operation.
- Conveying air that contains abrasive particles.

- Conveying highly corrosive air, e.g. salt spray. Exception: devices designed for salt spray and correspondingly protected.
- Conveying air with high dust content, e.g. suctioning off sawdust.
- Operating the device close to flammable materials or components.
- Operating the device in an explosive atmosphere.
- Using the device as a safety component or to perform safety-related functions.
- Operation with completely or partially disassembled or manipulated protective devices.
- In addition, all applications not listed among the intended uses.

ebmpapst

Approval	UL 1004-7 + 60730-1; EAC; CSA
	C22.2 No. 77 + CAN/CSA-E60730-1

With regard to cyclic speed loads, note that the rotating parts of the device are designed for a maximum of one million load cycles. If you have special questions, consult ebm-papst for support.

⇒ Use the device in accordance with its degree of protection.

#### Information on surface quality

The surfaces of the products conform to the generally applicable industrial standard. The surface quality may change during the production period. This has no effect on strength, dimensional stability and dimensional accuracy.

The color pigments in the paints used perceptibly react to UV light over the course of time. This does not however in any way affect the technical properties of the products. The product is to be protected against UV radiation to prevent the formation of patches and fading. Changes in color are not a reason for complaint and are not covered by the warranty.

# 3.5 Mounting data

Any further mounting data required can be taken from the product drawing or Section Chapter 4.1 Mechanical connection.

Strength class of screws	8.8		

⇒ Secure the screws against unintentional loosening (e.g. use selflocking screws).

#### 3.6 Transport and storage conditions

Max. permitted ambient temp. for motor (transport/ storage)	+80 °C
Min. permitted ambient temp. for motor (transport/ storage)	-40 °C

# 3.7 Electromagnetic compatibility

-	According to EN 61000-6-2 (industrial
interference	environment)
	According to EN 61000-6-3 (household
emission	environment), except EN 61000-3-2 for
	professionally used equipment with a
	total rated power greater than 1 kW

ranslation of the original operating instructions

If several devices are connected in parallel on the supply side so that the line current of the arrangement is in the range 16 - 75 A, this arrangement conforms to IEC 61000-3-12, provided that the short-circuit power Ssc at the connection point of the customer system to the public power grid is greater than or equal to 250 times the rated output of the arrangement. It is the responsibility of the installation engineer or operator/owner of the device to ensure, if necessary after consultation with the network operator, that this device is only connected to a connection point with an Ssc value greater than or equal to 250 times the rated output of the arrangement.

# 4. CONNECTION AND STARTUP

# 4.1 Mechanical connection

Risk of cutting and crushing when removing device from packaging

→ Carefully remove the device from the packaging by grasping hold of the frame. Never subject to any impact.

 $\rightarrow$  Wear safety shoes and cut-resistant safety gloves.

#### NOTE Damage to the device from vibration

Bearing damage, shorter service life

- $\rightarrow$  The fan must not be subjected to force or excessive vibration from sections of the installation.
- → If the fan is connected to air ducts, the connection should be isolated from vibration, e.g. using compensators or similar elements.
- → Ensure stress-free attachment of the fan to the substructure.
- ⇒ The fan may not be handled in the area around the inlet nozzle during transport and installation.

There is a risk of damage to the impeller.

- ⇒ Check the device for transport damage. Damaged devices are not to be installed.
- ⇒ Install the undamaged device in accordance with your application.

## 4.1.1 Installation of RadiPac fan

Use is always to be made of appropriate hoisting equipment and a suitable lifting device when transporting the fan for installation purposes. Only suitable round slings are to be used for this purpose (see Chapter 3.4 Technical description for weight of product). Use four round slings passed around the struts for lashing purposes. Position the round slings as shown in the hoisting diagram below. Make sure that the struts of the support bracket on the left and right of the motor are vertical. During installation, only transport the fan in the installation position as shown in the product drawing. Heed the information given on the device! During transportation, an acceleration of 2 g must not be exceeded.

Fig. 1: Hoisting diagram for transportation of RadiPac

Item no. 57895-5-9970 · ENU · Change 218407 · Approved 2020-12-17 · Page 6 / 16

#### CAUTION Possible damage to the device

If the device slips during installation, serious damage can result.

- $\rightarrow$  Ensure that the device is securely positioned at its place of
- installation until all fastening screws have been tightened.
- The fan must not be strained on fastening.

## 4.2 Electrical connection

#### DANGER Voltage on the device

Electric shock

- $\rightarrow$  Always connect a protective earth first.
- $\rightarrow$  Check the protective earth.

#### DANGER Faulty insulation

Risk of fatal injury from electric shock

- → Use only cables that meet the specified installation regulations for voltage, current, insulation material, capacity, etc.
- → Route cables so that they cannot be touched by any rotating parts.

# DANGER

Electrical charge (>50  $\mu$ C) between phase conductor and protective earth connection after switching off supply with multiple devices connected in parallel. Electric shock, risk of injury

→ Ensure sufficient protection against accidental contact. Before working on the electrical hookup, short the supply and PE connections.

# CAUTION

#### Voltage

The fan is a built-in component and has no disconnecting switch.

- → Only connect the fan to circuits that can be switched off with an all-pole disconnection switch.
- → When working on the fan, secure the system/machine in which the fan is installed so as to prevent it from being switched back on.

# NOTE

#### Device malfunctions possible

Route the device's control lines separately from the supply line.

→ Maintain the greatest possible clearance. Recommendation: clearance > 10 cm (separate cable routing)

## NOTE

#### Water ingress into wires or cables

Water ingress at the customer end of the cable can damage the device.

→ Make sure the end of the cable is connected in a dry environment.

Only connect the device to circuits that can be switched off with an all-pole disconnection switch.

#### 4.2.1 Requirements

- ⇒ Check whether the information on the nameplate matches the connection data.
- ⇒ Before connecting the device, make sure the power supply matches the device voltage.
- ⇒ Only use cables designed for the current level indicated on the nameplate.

For determining the cross-section, note the sizing criteria according to EN 61800-5-1. The protective earth must have a cross-section equal to or greater than that of the phase conductor. We recommend the use of 105 °C cables. Ensure that the minimum cable cross-section is at least AWG 26 / 0.13 mm<sup>2</sup>.

#### Protective earth contact resistance according to EN 61800-5-1

Compliance with the resistance specifications according to EN 61800-5-1 for the protective earth connection circuit must be verified in the end application. Depending on the installation situation, it may be necessary to connect an additional protective earth conductor by way of the extra protective earth terminal provided on the device. The protective earth terminal is located on the housing and provided with a protective earth symbol and a hole.

#### 4.2.2 Supply connection and fuses

Assignment of supply cable cross-sections and their required fuses (line protection only, no equipment protection).

Nominal voltage	Fuse		Automatic circuit breaker	Cable cross- section	Cable cross- section
	VDE	UL	VDE	mm²	*AWG
3/PE AC 380-480 VAC	16 A	15 A	C16A	1.5	16
3/PE AC 380-480 VAC	20 A	20 A	C20A	2.5	14
3/PE AC 380-480 VAC	25 A	25 A	C25A	4.0	12

\* AWG = American Wire Gauge

#### 4.2.3 Reactive currents

Because of the EMC filter integrated for compliance with EMC limits (interference emission and immunity to interference), reactive currents can be measured in the supply line even when the motor is at a standstill and the line voltage is switched on.

- The values are typically in the range < 250 mA</li>
- At the same time, the effective power in this operating state (operational readiness) is typically < 5 W.

ebmpapst

ebm-papst Mulfingen GmbH & Co. KG · Bachmühle 2 · D-74673 Mulfingen · Phone +49 (0) 7938 81-0 · Fax +49 (0) 7938 81-110 · info1@de.ebmpapst.com · www.ebmpapst.com

#### 4.2.4 Leakage current

For asymmetrical power systems or if a phase fails, the leakage current can increase to a multiple of the nominal value.

#### 4.2.5 Locked-rotor protection

Due to the locked-rotor protection, the starting current (LRA) is equal to or less than the nominal current (FLA).

# 4.3 Connection in terminal box

# 4.3.1 Preparing cables for connection

Only strip the cable as far as necessary, ensuring that the cable gland is sealed and there is no strain on the connections. For tightening torques, see Chapter 3.1 Product drawing.

#### NOTE Tightness and strain relief are dependent on the cable used.

 $\rightarrow$  This must be checked by the user.

Fig. 2: Recommended stripped lengths in mm (inside terminal box)

# 4.3.2 Connect cables to terminals

WARNING Live terminals and connections even with device switched off

- Electric shock
- $\rightarrow$  Wait five minutes after disconnecting the voltage at all poles before opening the device.
- ⇒ Open the terminal box.
- ⇒ Remove the cap from the cable gland.
- ⇒ Only remove caps where cables are fed in.

Fig. 3: Fit the connectors in the terminal box

Fit the cable glands with the seals provided in the terminal box.

- ⇒ Route the cable(s) (not included in the scope of delivery) into the terminal box.
- ⇒ Ensure separate routing of the supply cable(s) and the cables for status contact and control interface. Depending on the requirements for the end device, the physical separation of these cables in the terminal box may be mandatory. Use the partitions inside the terminal box as an aid to routing for this purpose.
- ⇒ First connect the protective earth "PE".
- ⇒ Connect the cables to the corresponding terminals. Use a screwdriver to do so. When connecting, make sure the wires do not splay out. Insert the strands until they meet with resistance.

#### Fig. 4: Connection of cables at terminals

- ⇒ There must not be any tensile stress between the terminal and the cable gland. The cable must be provided with strain relief.
- ⇒ The cable glands must be tight.
- ⇒ Fit the terminal box cover, making sure that the sealing surfaces are clean.
- ⇒ Screw in the four screws (for tightening torque, see Chapter 3.1 Product drawing).

# 4.3.3 Cable routing

NOTE

Water must be prevented from reaching the cable gland along the cable.

#### Damage caused by moisture penetration.

Moisture can penetrate into the terminal box if water is constantly present at the cable glands.

- → To prevent the constant accumulation of water at the cable glands, the cable should be routed in a U-shaped loop wherever possible.
- → If this is not possible, a drip edge can be produced by fitting a cable tie directly in front of the cable gland for example.

# 4.4 Factory settings

Factory settings made for the device by ebm-papst.

Mode parameter set 1	PWM control
Mode parameter set 2	PWM control

GREEN

#### 4.8 Checking connections

- ⇒ Ensure isolation from supply (all phases).
- Make sure a restart is impossible ⇒
- Check the cables for proper fit. ⇒
- Screw the terminal box cover back on again. Terminal box tightening ⇒ torque, see Chapter 3.1 Product drawing.
- Route the cables in the terminal box so that the terminal box cover closes without resistance.
- Use all screw plugs. Insert the screws by hand to avoid damage to ⇒ the threads.
- Make sure the terminal box is completely closed and sealed and that ⇒ all screws and cable glands have been properly tightened.

## 4.9 Switching on the device

The device may only be switched on if it has been installed properly and in accordance with its intended use, including the required safety mechanisms and professional electrical hookup. This also applies for devices which have already been equipped with plugs and terminals or similar connectors by the customer.

Hot motor housing Risk of fire

- → Ensure that no combustible or flammable materials are located close to the fan.
- ⇒ Before switching on, check the device for visible external damage and make sure the protective devices are functional.
- Check the fan's air flow paths for foreign matter and remove any foreign matter found.
- Apply the nominal supply voltage.
- Start the device by changing the input signal.

# Damage to the device from vibration

Bearing damage, shorter service life

- $\rightarrow$  Low-vibration operation of the fan must be ensured over the entire speed control range.
- $\rightarrow$  Severe vibration can arise for instance from inexpert handling, transportation damage and resultant imbalance or be caused by component or structural resonance.
- → Speed ranges with excessively high vibration levels and possibly resonant frequencies must be determined in the course of fan commissioning.
- → Either run through the resonant range as quickly as possible with speed control or find another remedy.
- $\rightarrow$  Operation with excessively high vibration levels can lead to premature failure.
- $\rightarrow$  The maximum permissible vibration severity must not exceed 3.5 mm/s and should be checked at intervals of 6 months. #It is to be determined at the motor mount at the motor support plate at least in axial direction and transversely to this. #Measurement of the vibration in all three axes is recommended and should be performed over the entire speed range in order to obtain a complete picture of the vibrations occurring in the application, see Chapter 6. Maintenance, malfunctions, possible causes and remedies.

# 4.10 Switching off the device

Switching off the device during operation:

- ⇒ Switch off the device via the control input.
- Do not switch the motor (e.g. in cyclic operation) on and off via power ⇒ supply.

Switching off the device for maintenance:

- Switch off the device via the control input.
- Do not switch the motor (e.g. in cyclic operation) on and off via power supply.
- Disconnect the device from the power supply. ⇒
- ⇒ When disconnecting, be sure to disconnect the ground connection last.

# 5. INTEGRATED PROTECTIVE FEATURES

The integrated protective functions cause the motor to switch off automatically in the event of the faults described in the table.

Fault	Safety feature description/ function
Rotor position detection error	An automatic restart follows.
Blocked rotor	⇒ After the blockage is removed, the motor restarts automatically.
Line undervoltage (line voltage outside of permitted nominal voltage range)	⇒ If the line voltage returns to permitted values, the motor restarts automatically.
Phase failure	A phase of the supply voltage fails for at least 5 s. ⇒ When all phases are correctly supplied again, the motor automatically restarts after 10-40 s.

# ebmpapst

# 6. MAINTENANCE, MALFUNCTIONS, POSSIBLE CAUSES AND REMEDIES

Do not perform any repairs on your device. Send the device to ebmpapst for repair or replacement.

WARNING Live termin

Live terminals and connections even with device switched off Electric shock

→ Wait five minutes after disconnecting the voltage at all poles before opening the device.

#### CAUTION

If control voltage or a stored speed set value is applied, the motor will restart automatically, e.g. after a power failure.

Risk of injury

- $\rightarrow$  Keep out of the device's danger zone.
- → When working on the device, switch off the line voltage and ensure that it cannot be switched back on.
- $\rightarrow$  Wait until the device comes to a stop.
- → After working on the device, remove any tools or other objects from the device.

If the device is not operated for a lengthy period in installed condition in a dry environment, it is to be started up and operated at full speed for one hour at least every four months. If the device is not operated for a lengthy period in installed condition in a damp environment (e.g. outdoors), it is to be started up and operated at full speed for at least two hours once a month to move the bearings and allow any condensate that may have ingressed to evaporate.

Malfunction/fault	Possible cause	Possible remedy
Impeller not running smoothly	Imbalance in rotating parts	Clean the device; replace it if imbalance persists after cleaning.
		Make sure no weight clips are removed during cleaning.
Motor not turning	Mechanical blockage	Switch off, isolate from supply and remove mechanical blockage.
	Line voltage faulty	Check line voltage, restore power supply. Attention! The error message resets automatically. Device restarts automatically without warning.
	Faulty connection	Isolate from supply, correct connection; see connection diagram.
	Broken motor winding	Replace device

Deficient cooling	Improve cooling. Let the device cool down. To reset the error message, switch off the line voltage for at least 25 s and then switch it on again. Alternatively, reset the error message by applying a control signal of < 0.5 V to Din1 or by shorting Din1 to GND.
Ambient temperature too high	Reduce the ambient temperature. Let the device cool down. To reset the error message, switch off the line voltage for at least 25 s and then switch it on again. Alternatively, reset the error message by applying a control signal of < 0.5 V to Din1 or by shorting Din1 to GND.
Impermissible point of operation (e.g. back pressure too high)	Correct the operating point. Let the device cool down. To reset the error message, switch off the line voltage for at least 25 s and then switch it on again. Alternatively, reset the error message by applying a control signal of < 0.5 V to Din1 or by shorting Din1 to GND.

In the event of further malfunctions, contact ebm-papst.

# 6.1 Warning/status codes

The LED on the electronics housing shows the motor status with various colors and flash codes. The flash codes have a frequency of 2 Hz. Each flash code is followed by a pause lasting 3 seconds. The following colors are used: Green: no warning or fault. Orange: There is a warning. No user intervention is required for warnings. Red: There is at least one error. See the following table. If there are multiple simultaneous errors, their associated flash codes are displayed in succession. If there are simultaneous warnings and errors, only the errors are displayed.

ebmpapst

#### 6.1.1 Warning codes

Number of pulses	Motor status - LED orange	Message at status relay
1	Current limitation in action	
2	Line impedance too high (DC-link voltage unstable)	
3	Power limiter in action	
4	Output stage temperature high	
5	Motor temperature high	
56	Temperature inside electronics high	
7	DC-link voltage low	
8	Braking mode: set in case of external drive in opposite direction at high speed for lengthy period	Yes
9	Calibration of rotor position sensor in progress	
10	Actual speed is lower than run monitoring speed limit	Yes
11	Open circuit at analog input or PWM input for the set value	Yes
13	DC-link voltage high	
15	Line voltage high	
16	Shake-loose function activated	

#### 6.1.2 Status codes

Manual reset by "Switch off line voltage - wait briefly - switch line voltage back on" or, if provided, via the "Fan enable/disable" input

Number of pulses	Motor status - LED red	Possible cause	Possible remedy
1	Phase failure or line undervoltage	Missing phase Poor power supply quality	Check line voltage
3	Output stage overheating	Electronics housing contaminated	Provide better cooling. Manual reset required
4	Communication error between master controller and slave controller	External supply applied via Vout for setting parameters. Internal error	Switch off line voltage - wait - switch back on
6	Motor overheating	Ambient temperature too high Impermissible operating point	Reduce ambient temperature Correct operating point. Manual reset required

7	Hall sensor error	Internal error	Switch off line voltage - wait - switch back on
8	Motor blocked	Mechanical blockage	Switch off - check safe isolation from supply - check freedom of movement of rotor
9	Speed limit exceeded	-	-
11	Rotor position sensor calibration error	Observe ebm-papst replacement instructions	Rotor position sensor calibration necessary. Notify ebm- papst
13	DC-link undervoltage	Line voltage not OK	Check the line voltage applied.

# 6.2 Vibration testing

Checking of fan for mechanical vibration based on ISO 14694. Recommendation: Every 6 months. Max. vibration severity is 3.5 mm/ s, measured at the motor fastening diameter on the motor support plate in the direction of the motor axis of rotation and perpendicular to this.

Fig. 5: Example illustrating vibration measurement. The arrangement of the sensors depends on the device concerned and the installation situation.

# 6.3 Cleaning

To ensure a long service life, check the fans regularly for proper operation and soiling. The frequency of checking is to be adapted accordingly depending on the degree of soiling.

Risk of injury from rotating fan.

→ Only clean when not in motion. Do not disconnect the fan from the power supply, just switch it off via the control input. This will prevent start-up of the fan.

⇒ Dirt deposits on the motor housing can cause overheating of the motor.

# **Operating instructions**

- ⇒ Soiling of the impeller can cause vibration that will shorten the service life of the fan.
- ⇒ Severe vibration can destroy the fan.
- ⇒ In such cases, switch off the fan immediately and clean it.
- ⇒ The preferred method of cleaning is dry cleaning, e.g. using compressed air.
- ⇒ Do not use aggressive cleaning agents!

#### NOTE

#### Damage to the device during cleaning Malfunction possible

- → Do not clean the device using a high-pressure cleaner.# Do not use acid, alkali or solvent-based cleaning agents.
- $\rightarrow$  Do not use any pointed or sharp-edged objects for cleaning.
- ⇒ Completely remove any cleaning agents used.
- ⇒ If severe corrosion is visible on load-bearing or rotating parts, switch off the device immediately and replace it.
- ⇒ Repair of load-bearing or rotating parts is not permitted!
- Operate the fan for 2 hours at maximum speed so that any water that has ingressed can evaporate.
- ⇒ If cleaning does not eliminate vibrations, the fan may need to be rebalanced. To have it rebalanced, contact ebm-papst.
- ⇒ The fan is equipped with maintenance-free ball bearings. The lifetime lubrication of the ball bearings is designed for a service life of 40,000 hours.
- If bearing replacement is necessary after that period, contact ebmpapst.
- ⇒ Adapt the maintenance intervals to the actual level of dust exposure.

#### 6.4 Safety inspection

#### NOTE

#### High-voltage test

The integrated EMC filter has Y capacitors. The tripping current is exceeded when AC testing voltage is applied.

→ Test the device with DC voltage when you perform the legally required high-voltage test. The voltage to be used corresponds to the peak value of the AC voltage required by the standard.

## 6.5 Disposal

For ebm-papst, environmental protection and resource preservation are top priority corporate goals.

ebm-papst operates an environmental management system which is certified in accordance with ISO 14001 and rigorously implemented around the world on the basis of German standards.

Right from the development stage, ecological design, technical safety and health protection are fixed criteria.

The following section contains recommendations for ecological disposal of the product and its components.

#### 6.5.1 Country-specific legal requirements

#### Country-specific legal requirements

Always observe the applicable country-specific legal regulations with regard to the disposal of products or waste occurring in the various phases of the life cycle. The corresponding disposal standards are also to be heeded.

#### 6.5.2 Disassembly

NOTE

Disassembly of the product must be performed or supervised by qualified personnel with the appropriate technical knowledge. The product is to be disassembled into suitable components for disposal employing standard procedures for motors.

# WARNING

Heavy parts of the product may drop off. Some of the product components are heavy. These components could drop off during disassembly.

This can result in fatal or serious injury and material damage.

 $\rightarrow$  Secure components before unfastening to stop them falling.

#### 6.5.3 Component disposal

The products are mostly made of steel, copper, aluminum and plastic. Metallic materials are generally considered to be fully recyclable. Separate the components for recycling into the following categories:

- Steel and iron
- Aluminum
- Non-ferrous metal, e.g. motor windings
- Plastics, particularly with brominated flame retardants, in accordance with marking
- Insulating materials
- Cables and wires
- Electronic scrap, e.g. circuit boards

# **Operating instructions**

Only ferrite magnets and not rare earth magnets are used in external rotor motors from ebm-papst Mulfingen GmbH & Co. KG.

⇒ Ferrite magnets can be disposed of in the same way as normal iron and steel.

Electrical insulating materials on the product, in cables and wires are made of similar materials and are therefore to be treated in the same manner.

The materials concerned are as follows:

- Miscellaneous insulators used in the terminal box
- Power cables
- Cables for internal wiring
- Electrolytic capacitors

Dispose of electronic components employing the proper procedures for electronic scrap.

 $\rightarrow$  Please contact ebm-papst for any other questions on disposal.

GREEN

Item no. 57895-5-9970 · ENU · Change 218407 · Approved 2020-12-17 · Page 16 / 16
